Inflation: Preparing Income Portfolios for the Next Risk

By Anders Persson, CFA®, Nathan Shetty, CFA®, FRM, and Brian Griggs, CFA®, CMT, FRM
As the world emerges from the coronavirus pandemic, a combination of easy monetary policy, massive fiscal stimulus, a rebounding labor market, and rising consumer spending has led to increased inflation pressures. How can investors manage the potential risks while also positioning portfolios to take advantage of the shifting environment?

ARE INFLATION FEARS WARRANTED?

U.S. consumer price inflation has accelerated to more than 6 percent year-over-year, solidifying 2021 as a sustained period of high inflation that has not been seen since the early 1980s (see figure 1).

WHAT CAUSED THIS INFLATION SPIKE?

Governments around the world implemented historic stimulus programs throughout 2020 and 2021 to combat the expected economic fallout of COVID-19 and shelter-in-place policies.

Global central banks quickly cut rates to zero in 2020 and engaged in direct purchases of fixed income securities, known as quantitative easing (QE). QE reduced the supply of high-quality fixed income securities on the open market, pushing fixed income investors out on the risk curve. In turn, corporations had access to easier financing to continue their operations despite the economic shutdown. In fact, 2020 saw $1.9 trillion in U.S. investment-grade corporate bond issuance, a 64-percent increase versus the previous 10-year average.

In 2021, $1.5 trillion came to market through the beginning of December.

Economic growth data is the strongest in decades, fueled by vaccine rollouts and unprecedented federal fiscal stimulus. Household net worth has hit new all-time highs thanks to higher savings rates and rising asset prices (see figure 2).

The trillions of dollars in savings amassed during the pandemic have supported robust spending growth.

Consumer demand remains strong and continues to overwhelm global supply chains that are still hampered by COVID-19 (see figure 3). We expect this dynamic to moderate in 2022 as
supply increases and consumer preferences shift to services.

**NO, WE'RE NOT RETURNING TO THE 1970s**

In the early 1970s, the Federal Reserve misjudged how loose it could run monetary policy at a time of large budget deficits, wage and price controls, and the U.S. dollar's recent departure from the gold standard.

As a result, prices rose in the United States at a time of high unemployment. The so-called “Misery Index”—the sum of the inflation rate and the unemployment rate—peaked at 22 percent in 1980, with 14.4 percent inflation and 7.3 percent unemployment.

Today's scenario is much different. For the first time in decades, investors find themselves in a high-pressure economic system. Inflation is running high in developed economies, while unemployment continues to trend lower and wage growth is accelerating. The current Misery Index is 10.4 percent (6.2 percent inflation and 4.2 percent unemployment), slightly above the long-term average of 9 percent (see figure 4).

Further, the underlying components of the Consumer Price Index (CPI) basket show that the largest increases are different today. The Atlanta Federal Reserve publishes indexes that distinguish the rate of change of the sticky components of the CPI basket, e.g., housing, recreation, medical care, furniture, and education, versus flexible items that change in price more frequently, e.g., new vehicles, gas and electricity, motor fuel, and lodging away from home. Both indexes spiked in the 1970s, but today there is a clear divergence between the two.

These components of flexible CPI can certainly have a meaningful impact on consumer sentiment and discretionary spending. However, since the 1990s, flexible CPI items have proven that they can rise—and eventually moderate—

---

**U.S. CONSUMERS ARE STILL SUPPORTED BY GROWING WEALTH, RISING INCOMES, AND EXCESS SAVINGS**

Consumer demand for finished goods

---

**SHARE OF U.S. CONSUMPTION SPENT ON GOODS IS STILL ABNORMALLY HIGH**

---

**UNLIKE IN THE 1970s, INFLATION AND THE UNEMPLOYMENT RATE ARE TRENDING IN DIFFERENT DIRECTIONS**

without negatively impacting global growth or becoming a headwind to equity and credit markets, as we witnessed in 2021 (see figure 5).

**PREPARE PORTFOLIOS FOR INFLATION ABOVE PRE-PANDEMIC LEVELS, NOT FOR ‘STAGFLATION’**

Investors—particularly those who are retired and perhaps living on fixed budgets—are equally concerned about their savings eroding in the near-term (71 percent) as they are about outliving their savings in the long-term (72 percent).\(^1\) Portfolios should be constructed to address both these concerns by diversifying across assets that can perform in a range of economic environments, regardless of the near-term inflation outlook. That means allocating to strategies that can provide real, after-inflation returns during deflationary environments (see table 1, column 1), periods where inflation is closer to its long-term trend (columns 2 and 3), as well as periods where inflation is elevated and rising (column 4).

At the extremes (columns 1 and 4), daily liquid risk assets generally do not fare particularly well after inflation. This is to be expected, because investors collect a risk premium (total return or income) for owning assets that periodically will experience drawdowns during challenging economic environments.

But these time periods are outliers, representing only one-fifth of all quarters over the past 33 years, and markets

do recover. Although inflation might remain above trend in 2022 (something more akin to column 3), we believe this already has been priced into the markets. Therefore, we don’t believe this is the time to overweight conventional inflation hedges such as TIPS or commodities, which already have performed well in response to the recent acceleration in consumer prices and today offer negative carry, i.e., income yields below the rate of inflation. Perhaps most importantly, now is not the time to be overweight in cash, which may be a way to mitigate near-term volatility but not without hindering the portfolio’s real return potential and long-term purchasing power.

... now is not the time to be overweight in cash, which may be a way to mitigate near-term volatility but not without hindering the portfolio’s real return potential and long-term purchasing power.

HOW TO PREPARE PORTFOLIOS
There are two ways to generate real returns in an inflationary environment: (1) own positive carry investments that generate an income rate higher than the rate of inflation, and (2) own investments that tend to experience positive price appreciation in response to inflation.

The first category is harder to come by these days in traditional fixed income, but opportunities still exist. We have a favorable outlook for owning lower-quality fixed income sectors that can better withstand a gradual rise in interest rates, such as floating-rate loans and preferred securities, particularly those with fixed-to-float coupon features. The prospect for higher marginal U.S. tax rates should continue to support flows into the tax-exempt space, benefiting high yield municipals.

As for the second category, public equities over the past 30 years have lived up to their reputation as a hedge against moderately higher inflation and should continue to do so. Heading into 2022, Nuveen’s equity team is choosing sectors with a cyclical tilt that should outperform as the rest of the developed world catches up to the U.S. economic reopening, and are more favorable on a valuation basis, such as non-U.S. developed equities and U.S. small caps.

What about strategies that have the potential to fall in both categories? For investors who do not require 100 percent of their portfolios to be invested in daily liquid strategies, private markets can provide more stable real returns and competitive distribution yields over public market equivalents. Private real estate stands out as a category that can fill this role. Inflation has different implications depending on the geographic region and property type, but most long-term leases have built-in rent escalators that are tied to inflation, which protects the income generation of in-place leases.

BOTTOM LINE
We think investors should expect, but not overreact to, elevated inflation and higher interest rates. We think markets have mostly priced in the likelihood of elevated inflation in 2022 and U.S. Federal Reserve tightening. Public equity and credit markets still can thrive in environments of low—but—climbing rates and elevated inflation. Real assets and real estate remain important inflation hedges in addition to their fundamental attractiveness.
